

Customer Setup Guide

Everything your team needs to provide and configure to get started.

// step 1

What You Need to Provide

Before we can deploy your VPN, please provide the following:

Item	Details	Required
Google OAuth Client ID	From Google Cloud Console → APIs & Services → Credentials	✓
Google OAuth Client Secret	From Google Cloud Console → APIs & Services → Credentials	✓
Allowed email domain(s)	e.g. yourcompany.com — only these emails can access the VPN	✓
VPN portal subdomain	e.g. vpn.yourcompany.com — you manage the DNS	✓
Let's Encrypt contact email	Used for SSL certificate expiry notifications	✓
Preferred server region	e.g. Amsterdam, Frankfurt, New York	Optional

// step 2

Google OAuth Setup

In your Google Cloud Console, create an OAuth 2.0 client and add the following authorized redirect URI:

<https://vpn.yourcompany.com/auth/callback>

Replace vpn.yourcompany.com with your actual VPN portal subdomain.

1. Go to console.cloud.google.com
2. Select your project (or create one)
3. Navigate to APIs & Services → Credentials
4. Click "Create Credentials" → OAuth 2.0 Client ID
5. Application type: Web application
6. Add the redirect URI above to "Authorized redirect URIs"
7. Copy the Client ID and Client Secret — send these to us securely

// step 3

DNS Configuration

Add an A record in your DNS provider pointing your VPN subdomain to the server IP we provide:

Type	Name	Value	TTL
A	vpn	<server_ip_provided_by_rzilient>	3600

// step 4

Restrict Your Web App (Rails)

Add the following middleware to your Rails application to restrict access to VPN users only:

1. Create app/middleware/vpn_restriction.rb:

```
class VpnRestriction def initialize(app) @app = app end def call(env) return @app.call(env) if ENV["VPN_RESTRICTION_DISABLED"] == "true" ip = env["HTTP_X_FORWARDED_FOR"] &.split(",")&.first&.strip || env["REMOTE_ADDR"] unless ENV.fetch("VPN_ALLOWED_IPS", "").split(",").map(&:strip).include?(ip) return [403, {"Content-Type"=>"text/html"}, ["403 - Access DeniedConnect to VPN."]] end @app.call(env) end end
```

2. Register in config/application.rb:

```
require_relative "../app/middleware/vpn_restriction" module YourApp class Application < Rails::Application config.middleware.insert_before 0, VpnRestriction if Rails.env.production? end end
```

3. Set environment variables in your hosting platform:

Variable	Value	Description
VPN_ALLOWED_IPS	<provided_by_rzilient>	VPN server public IP — we provide this
VPN_RESTRICTION_DISABLED	false	Set to "true" to bypass VPN restriction in emergency

// emergency access

■ Emergency VPN Bypass

If the VPN is unreachable and your team needs immediate access to the backoffice, set the following environment variable in your hosting platform without redeploying your app:

Variable	Value	Effect
VPN_RESTRICTION_DISABLED	true	Bypasses IP check — all traffic allowed

- This completely removes VPN protection — use only in genuine emergencies
- Re-enable protection immediately by setting VPN_RESTRICTION_DISABLED=false
- No app redeploy required — takes effect on next request after env var is saved
- Notify your rzilient contact when using emergency bypass

// step 5

Team Onboarding

Once the VPN is deployed, each team member follows these steps:

Step	Action
1	Go to https://vpn.yourcompany.com
2	Sign in with your company Google account (@yourcompany.com)

3	Click "Generate my credentials"
4	Download the .conf file or scan the QR code
5	Install WireGuard (Mac App Store / brew install wireguard-tools)
6	Import the .conf file into WireGuard
7	Toggle VPN on — access your backoffice as normal

// note

Firewall & Network Notes

- Clients do NOT need any inbound ports open — WireGuard uses outbound UDP only.
- VPN works on port 51820 (UDP) by default. Port 443 (UDP) is also available as a fallback for strict corporate firewalls.
- To use the 443 fallback, change the Endpoint port in the .conf file from 51820 to 443.
- Works behind NAT, home routers, and most corporate networks without any special configuration.
